

DEVOPS SERVICES

AGENDA

What is DevOps?

What does the DevOps Services specialize in?

Selection and justification.

WHAT IS DEVOPS?

DevOps is a software development methodology that unites practices, processes, and tools geared toward expediting product release and enhancing code quality.

The key DevOps principles embrace automation, iteration, collaboration, communication, and CI/CD.

ACTIVITIES WE OFFER:

Audit of existing processes CI/CD and infrastructure.

Refinement and optimisation of existing CI/CD processes.

Support and maintenance of existing systems.

Building from scratch a development, testing and deployment automation system.

Set up additional infrastructure to quickly detect and respond to problems.

DESCRIPTION OF THE DEVOPS AS A SERVICE PROCESS

It's a service that creates a process for automating the operation of software as part of the development or audit of an existing infrastructure.

HOW THE SERVICE BUILDING PROCESS WORKS:

- ✓ NDA signing;
- ✓ A 482.solutions specialist conducts an audit of the current system or selects the customer's wishes for process automation;
- ✓ A backlog is created with a list of tasks for implementing the project in Jira or another accounting tool;
- ✓ Each task is evaluated and executed by DevOps team, based on the results - the client is provided with a report with completed tasks over a period of time.

Mutual settlements are carried out according to the Fix price or T&M model.

It is possible to sign an SLA for the participation of a specialist in the framework of a project on support with a dedicated load per week.

OUR TRUSTED PARTNERS

We believe velocity, resilience, and rapid changes contribute to a competitive advantage. That's why we partner with our clients to architect and implement DevOps best practices that accelerate software delivery, anticipate compliance and security risks, and drive forward digital transformation.
